## Nevada's Veteran Unemployment Rate Trending Below Overall Rate; 4.9 Percent Over Past 12 Months vs. Five Percent for All Nevadans

- Information from the monthly Current Population Survey (CPS), sponsored by the Census Bureau and the Bureau of Labor Statistics, allows for the analysis of the labor market status of the Silver State's veteran population.
- At its peak in mid-2011, the veteran unemployment rate stood at 14.7 percent--slightly higher than the peak rate for total unemployment, which was 14.4 percent <sup>1</sup> at the end of 2010.
- However, since 2012, the unemployment rate for veterans has been notably lower than the total rate. In December, veterans have an unemployment rate of 4.9 percent (expressed as a 12-month moving average), up from four percent a year ago. Due to a small sample size, there is considerable volatility in CPS-based estimates. We would not place too much weight on the short-term increase in the veteran jobless rate. The overall trend suggests it is declining.
- In comparison, the total unemployment rate is five percent this month (again, expressed as a 12-month moving average), down nearly one percentage point from December last year.

<sup>1</sup> It should be noted that utilizing information solely from the CPS results in a slightly different total unemployment rate than what is officially reported. The State's official rate incorporates information regarding job trends and unemployment insurance claims activity into the calculation, in addition to CPS results.
